

SA JKA National Dan Grading - GitHub Pages

This version is prepared for GitHub Pages deployment.

Files

- `index.html` - main app file
- `404.html` - redirect page for GitHub Pages

How to publish on GitHub Pages

1. Create a GitHub repository.
2. Upload `index.html` and `404.html` into the repository root.
3. Go to **Settings > Pages**.
4. Under **Build and deployment**, choose:
 - **Source:** Deploy from a branch
 - **Branch:** `main` (or your active branch)
 - **Folder:** `/root`
5. Save the settings.
6. Wait a minute or two for GitHub Pages to publish the site.

Recommended repository structure

If you later add supporting files, use:

```
/ (repo root)
index.html
404.html
/assets
```

Notes

- Keep file and folder names lowercase.
- Use relative paths like `./assets/file.pdf`.
- If this is a project repository rather than `username.github.io`, GitHub Pages will publish it in a subfolder, so relative paths are safer than root-absolute paths.
- Review all grading rules, dates, fees, and indemnity text before production use.
